Horaismoptera HENDEL, 1907

HENDEL, 1907: Wien. ent. Ztg., 26: 238.

Type-species: *Horaismoptera vulpina* HENDEL, 1907: l.c.: 240 (mon.).

vulpina HENDEL, 1907: Wien. ent. Ztg., 26: 240 (*Horaismoptera*). Type-locality: Abd-elKari [= Abd-al-Kuri Is., Yemen].—Distr.: North Africa: Egypt; Asia: Saudi Arabia.

Family Milichiidae

By L. PAPP

Small to very small, usually dark flies; costal vein broken just proximally to conjointment with radial vein r_1 and broken or very much tapering distally to humeral vein; 1–4 pairs of inclinate lower frontoorbitals, 2–3 pairs of upper frontoorbitals; several interfrontal pairs (disarranged in several cases); female cerci fused.

Facial plate (praefrons) flat or with antennal foveae but latter not deep; no high and sharp facial keel. Lunule with a pair of bristles in several cases. Palps large to very large, setose. Male third antennal joints enlarged in some species. Proboscis usually elongate, in several genera labellae very long. Frontal chaetotaxy (other than above): 1 pair each of strong *vte*, *vti* and *oc*, one pair of *pvf* of various inclinations. Postoculars usually strong with one inner and outer occipital pairs each. Vibrissae strong, peristomal and genal bristles various in length. Thoracic chaetotaxy: 1-(2) *h*, 2 *np*, 0-1 *posth*, (0)-1 *prst*, 1-3 *sa*, 2 *pa*, 0-1 + 2-4 *dc*, 0-1 *prsc*, 2 *sc*, 1 *sig*, 0-2 *pp*, 1-4 *st* bristle pairs: in numerous species also mesopleuron setose (Madizinae). Legs simple, tibiae without dorsal preapicals. Subcostal vein complete but very thin; basal cell and anal cell always present; anal vein welldeveloped or replaced by a long vein-fold. In males of some species abdominal tergites completely or partly silvery. Male epandrium small, male cerci usually elongate or enlarged, surstyli usually simple, phallus not coiled. Females with chitinized though retractile abdominal segments 7-9. Female cerci free, not fused. No sclerotized spermathecae.

The larvae are slightly S-shaped with distinct intersegmental transverse tubercles. Cephalopharyngeal skeleton basically same as in other cyclorrhaphans, with dentate sclerites, parastomal rods, intercalar and hypostomal sclerites and with longitudinal ridges on ventral cornua. Dorsal cornua essentially smaller than ventrals. Anterior spiracles with spherical or digitiform papillae. Posterior spiracles with 3 interspiracular processes (hair-like distally) or with numerous branching long hairs in 3 groups. Segment 12 with or without wart-like processes dorsally. No pupal horns, posterior spiracles slightly elevated on pupae.

The larvae are coprophagous or saprophagous in the widest sense. They have been reared from dung (droppings, manure heaps and stables), kitchen refuse, birds' nests and amorphous plant detritus. Some species have been found in ants' nests. Adults of some species are commensalists of predatory insects, some other species are sucking flower nectar.

- seguyi* HENNIG, 1937: 60a. Milichiidae et Carnidae, Fliegen pal. Reg., 6(1): 23 (*Milichia*). Type-locality: Yakouren (Algeria).—Distr.: North Africa: Algeria.
- speciosa* MEIGEN, 1830: Syst. Beschr., 6: 132 (*Milichia*). Type-localities: Marseille, Provence and "Hr. Megerle von Mühlfeld theilte mir es gleichfalls mit, jedoch ohne Angabe des Wohnortes".—Distr.: Europe: E, F, I, CH, H, YU, R; USSR: SET, ?FE; North Africa: Morocco; Asia: Palestine.
- speciosa canariensis* BECKER, 1907: Annls hist.-nat. Mus. natn. hung., 5: 517 (*Milichia*). Type-locality: La Palma, Gran Canaria (Canary Is.).—Distr.: Canary Is. Probably a separate species.

Eccoptomma BECKER, 1907

- BECKER, 1907: Annls hist.-nat. Mus. natn. hung., 5: 540.
Type-species: *Eccoptomma frontale* BECKER, 1907: l.c.: 542 (des. MALLOCH, 1934: Diptera of Patagonia and South Chile, 6(5): 463); not Palearctic.
- freyi* HENDEL in FREY, 1936: Commentat. biol., 6: 125 (*Eccoptomma*). Type-locality: Tenerife, Icod de los Vinos (Canary Is.).—Distr.: Canary Is.

Milichiella GIGLIO-TOS, 1895

- GIGLIO-TOS, 1895: Annls Soc. ent. Fr., 64: 367.
Type-species: *Tephritis argentea* FABRICIUS, 1805: Syst. antl.: 323 (mon.); a misidentification of the species, which was described later as *Milichiella tosi* BECKER, 1907; not Palearctic. Since the type-species was misidentified, the

- case should have been referred to the I.C.Z.N. (cf. SABROSKY, 1969: Cat. Dipt. North America: 733; Sabrosky, 1973: Cat. Dipt. South America: 75.4.).
- Ophthalmomyia* WILLISTON, 1896: Trans. R. ent. Soc. Lond., 1896: 426. Type-species: *Lobioptera lacteipennis* LOEW, 1866: Berl. ent. Z., 9(1865): 185 (mon.).
- Stenoporomyia* HENDEL, 1903: Wien. ent. Ztg., 22: 250. Type-species: *Lobioptera tiefii* MIK, 1887: Verh. zool.-bot. Ges. Wien, 37: 178 (mon.).
- argentiventris* HENDEL, 1931: Bull. Soc. ent. Égypte (N.S.), 15(2): 72 (*Milichiella*). Type-locality: Wadi Kanssirrob (Gebel Elba) (Egypt).—Distr.: North Africa: Egypt.
- argyrogaster* (PERRIS, 1876): Annls Soc. ent. Fr., (5) 6: 208 (*Milichia*). Type-locality: Dept. Landes (France).—Distr.: Europe: F, A, H; USSR: NET, FE (Ussuri region).
- tiefii* (MIK, 1887): Verh. zool.-bot. Ges. Wien, 37: 178 (*Lobioptera*). Type-locality: Villach in Kärnten (Austria).
- bimaculata* BECKER, 1907: Annls hist.-nat. Mus. natn. hung., 5: 534 (*Milichiella*). Type-locality: Gran Canaria (Canary Is.).—Distr.: Canary Is. (Tenerife, Gran Canaria).
- bimaculata* BECKER, 1908: Mitt. zool. Mus. Berl., 4(1): 163 (*Milichiella*). Type-locality: Tenerife (Canary Is.).
- lacteipennis* (LOEW, 1866): Berl. ent. Z., 9(1865): 185 (*Lobioptera*). Type-locality: Cuba.—Distr.: Asia: Afghanistan; Canary Is., Madeira Is.; Nearctic, Neotropical, Afrotropical and Oriental Regions.

Subfamily Madizinae

Madiza FALLÉN, 1810

- FALLÉN, 1810: Specim. entom. novam Dipt.: 19.
Type-species: *Madiza glabra* FALLÉN, 1820: Oscinides Sveciae: 9 (des. HENDEL, 1903: Wien. ent. Ztg., 22: 251).*
- Cleptoneria* LIOY, 1864: Atti Ist. veneto Sci., (3) 9: 1120. Type-species: *Madiza glabra* FALLÉN, 1820: Oscinides Sveciae: 9 (mon.).
- Polphorina* ENDERLEIN, 1921: Zool. Anz., 52(8/9): 231. Type-species: *Piophila flavitarsis* MEIGEN, 1830: Syst. Beschr., 6: 383 (mon.) [= *glabra* FALLÉN, 1820].

* The earliest type-designation for *Madiza* FALLÉN is actually *Madiza oscinina* FALLÉN, 1820 [now *Siphonella oscinina* (FALLÉN), Chloropidae], des. by RONDANI, 1856: Dipt. Ital. Prodromus, I: 128. Since most workers have treated *Madiza* as a milichiid, that usage is reasonable to be maintained. Suspension of the Rules has been applied for (SABROSKY, 1973: Bull. zool. Nom., 30: 126-128). The description of the case is quoted from SABROSKY, 1977: Cat. Dipt. Orient. Reg., 3: 272.

- britannica** HENNIG, 1937: 60a. Milichiidae et Carnidae, Fliegen pal. Reg., 6(1): 53 (*Madiza*). Type-locality: Cambs., Snailwell (England).—Distr.: Europe: GB, CH.
- glabra** FALLÉN, 1820: Oscinides Sveciae: 9 (*Madiza*). Type-localities: Scania, Ostrogothia (Sweden).—Distr.: all parts of Europe (incl. the European part of the USSR); USSR: TC, WS, KZ, SMA, FE; Asia: Turkey, Iran, Afghanistan, Mongolia, China; North Africa: Morocco, Algeria, Tunisia, Egypt; Canary, Madeira and Azores Is.; Nearctic Region.
- flavitarsis** (MEIGEN, 1830): Syst. Beschr., 6: 383 (*Piophila*). Type-locality: nr Aachen (Germany).
- rufitarsis** (MEIGEN, 1838): Syst. Beschr., 7: 384 (*Gymnopa*). Type-locality: not given ("Kaltenbach coll.").
- pachymera** BECKER, 1908: Annls hist.-nat. Mus. natn. hung., 6: 320 (*Madiza*). Type-locality: Ugod (Hungary).—Distr.: Europe: H, YU.

Desmometopa LOEW, 1866

- LOEW, 1866: Berl. ent. Z., 9(1865): 184 (Centuria 6, No. 96). Type-species: *Agromyza m-atrum* MEIGEN, 1830: Syst. Beschr., 6: 170 (des. HENDEL, 1903: Wien. ent. Ztg., 22: 251 [= *sordida* (FALLÉN, 1820)].
- Liodesma* DUDA, 1935: Natuurh. Maandbl., 24: 25. Type-species: *Liodesma atra* DUDA, 1935: l.c.: 25 (mon.) [= *sordida* (FALLÉN, 1820)].
- Liodesmometopa* DUDA, 1935: Natuurh. Maandbl., 24: 24 (invalid: published first time as a synonymous name to *Liodesma* DUDA).
- microps* LAMB, 1914: Trans. Linn. Soc. Lond. (2) Zool., 16(4): 364 (*Desmometopa*). Type-locality: Seychelles.—Distr.: Asia: Afghanistan, Nepal, China (Manchuria: Charbin), Japan; Oriental Region and the Seychelles Is.

Taxa removed from the family

Horaiomoptera HENDEL, 1907: Wien. ent. Ztg., 26: 238.

Type-species: **Horaiomoptera vulpina** HENDEL, 1907: Wien. ent. Ztg., 26: 240 (mon.). To Tethinidae.

Family Carnidae

By L. PAPP

Very small (1.0–2.4 mm) black flies; costal vein broken just proximally to conjunction with radial vein r_4 , and broken or becoming very thin distally to humeral vein; 2 pairs of inclinate lower and 2 pairs of exinate upper frontoorbitals; only 1 if' pair in supralunular position; female cerci fused. Head rounded, frons wide with big frontal triangle. Facial plate (praefrons) with deep antennal foveae and distinct facial keel. Clypeus very thin and hidden. Palpi very small, labellae only exceptionally long. Cephalic bristles other than frontoorbitals: strong vte and vvi pairs and ocellars. Postverticals weak, exinate, inclinate, parallel or absent; 3–4 pairs of strong vibrissae, usually a row of genal bristles.

Thoracic chaetotaxy: 1 h (occasionally some additional short h), 2 np , 1 $prst$, 1 sa , 1 pa , 1 posterior ia , 0–1 + 1–3 dc , 0–1 $prsc$, 2 sc . Meso- and sternopleura setulose, usually with at least 1 characteristic bristle each. No dorsal preapicals on tibiae, fore femora with 1 or more long and thick bristles posteroventrally. In the majority of species there are no anal cell and anal vein on wings (except for *Hemeromyia* Coq.). Crossveins rather basal in position, hind crossvein occasionally absent (*Carnus* NITZSCH). Abdomen with 5 preabdominal segments in both sexes, abdominal spiracles in membrane. Male tergites 6–8 weakly sclerotized and more or less fused. In most species two pairs of epandrial processes (anterior one named "lamella", posterior one "surstylos"). Penis long, curved or coiled with numerous spinules. Male 9th sternite (forked plate) distinct, usually of characteristic shape and armature. Female 6th tergite and sternite usually small, even if sometimes large, withdrawn in 5th segment, segments 7–10 telescoping, hardly sclerotized, 8th segment completely membranous, cerci fused. No sclerotized spermathecae.

Larvae saprophagous, comparatively simple, slightly S-shaped, with cephalopharyngeal skeleton similar to that of other saprophagous fly families but weakly chitinized (except for mouth hooks and hypostomal sclerite); anterior spiracles with 5–7 (*Carnus*) or 3 (*Meoneura*) short protuberances, posterior spiracles always with 3 protuberances each. Pupae black, short and cylindrical with posterior spiracles at caudal end (*Carnus*) or in dorsal position (*Meoneura*).

The larvae are living in birds' nests as semiparasitic-saprophagous (*Carnus*) or saprophagous (*Meoneura*), or they develop in droppings of animal or in other dead organic substances (exceptionally in carrion).

The majority of the species are Palaearctic or Nearctic, some of them show a Holarctic distribution, very few species occur in other regions. Numerous species are still undescribed in museum collections.

Doubtful species

baluchistani DUDA, 1936: Ann. Mag., nat. Hist., (10)18: 337 (*Meoneura*). Type-locality: Pakistan: Quetta. In all probability a junior synonym of *prima* (BECKER, 1903).
geniculata (STROBL, 1900): Wiss. Mitt. Bosn. Herzeg., 7: 640 (*Agromyza*, as var. of *vagans* FÄLLÉN, 1823). Type-localities: Mostar, Trebinje, Dalmatia (Yugoslavia).

Family Canacidae

(Canaceidae)

By B. H. COGAN

Cyclorrhapha, with the arista short, bare to short pubescent; three to five pairs of divergent frontoorbitals and postverticals absent; vibrissae present; facial bristles usually small or absent; costa with only one break at apex of r_1 ; subcosta visible along its length, except close to the apex of r_1 ; second basal and anal cells complete, but a small, short anal vein present; female with two spermathecae and with cerci hook-shaped.

Species of the Palearctic Canacidae are confined to the marine environment, where the adult flies are found on the seashore and the larvae live and feed upon algae on intertidal rocks. Details of the life-histories of members of the family are lacking for all but a minority of species, and there is little published information on the Palearctic fauna.

A small family of flies of worldwide distribution, represented in the Palearctic Region by only 16 species, the majority of which are found in the far eastern part of the region, mostly in Japan. Although in the past they were usually included in the Ephydriidae, the Canacidae are not particularly closely related to the latter family, but appear to be the sister-group of the Tethinidae.

References: WIRTH (1951) revised the World fauna and, for the Palearctic Region, his work should be used in conjunction with the papers of MIYAGI (1963–1973).
